Priority

1. Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

Drawings

2. Figures 1-3 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). Corrected drawings in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. The replacement sheet(s) should be labeled "Replacement Sheet" in the page header (as per 37 CFR 1.84(c)) so as not to obstruct any portion of the drawing figures. If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Specification

3. The disclosure is objected to because of the following informalities: a run-on sentence appears on page 7, lines 4-27.

Appropriate correction is required.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1 and 7 are rejected under 35 U.S.C. 102(b) as being anticipated by Lebizay et al (US 6,144,658).

Regarding claim 1, Lebizay discloses a method and apparatus for digital data compression. Data is separated into frames comprising bits and corresponding time slots. Data is transmitted from a transmitter to a receiver. The data will be transmitted until a repetitive pattern is detected (column 2, lines 8-22). Therefore, the content of the channel will be transmitted after the channel has gone to a static state but before the static state has been detected. After detection of the repetitive pattern in the receiver side, a control packet (descriptor) provides the receiver side with the repetitive pattern value (column 2, lines 23-31). Analysis of the received signal is done at the receiver and the repetitive pattern is regenerated and inserted in the output sample stream (column 2, lines 13-15).

Regarding claim 7, Lebizay discloses a data transmission system comprising a compressor and decompressor as shown in figure 1 and described in column 3, line 58 to column 4, line 51. This apparatus can be adapted to implement any method of data compression and decompression using the compressor and decompressor.

Allowable Subject Matter

5. Claims 2-6 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
